

CLAIMS

1. A multipurpose sled which comprises:

an upwards open container (1), which includes a bottom (15), a rear wall (16a,
5 16b, 16c), side walls (17) and a front wall (18);
runners (2) which extend backwards over the container; and
supporting means extending essentially as long as the runners for setting the
sled on the back ends of the runners and the supporting means for using the sled as a shelter,
characterised in that it comprises handles (3; 4, 5, 6) and means (7, 8, 9, 10, 11, 12) for
10 attaching the handles detachably to the rear portion (16) of the container in different
positions (P1, P2, P3) for different purposes of use so that in a first position (P2) the handles
(3, 3a) form said supporting means for setting the sled on the back ends (2a) of the runners
and the supporting means for using the sled as a shelter.

15 2. A sled according to claim 1, characterised in that the handle (3) includes an attachment
portion (6) and a grip portion (4) joining it in an angle.

3. A sled according to claim 2, characterised in that the grip portion (4) joins the
attachment portion (6) in essentially right angle.

20

4. A sled according to claim 1, characterised in that in a second position (P1) the handles
(3, 4) are curved forward for pushing the sled or for travelling by it.

5. A sled according to claim 1, characterised in that in a third position (P1) the handles (3,
25 4) are curved towards each other for pushing the sled or for travelling by it.

6. A sled according to claim 1, characterised in that the means for attaching the handles
detachably include vertical sleeves (7) attached to the rear wall (16a) of the sled which
sleeves have been adapted for attaching the handles thereto detachably in different positions.

30

7. A sled according to claim 6, characterised in that the section of the sleeve (7) is a regular
polygon and the handle (3) includes the attachment portion (6) adapted to the inner
dimensions of and having the corresponding section than the sleeve.

35 8. A sled according to claim 7, characterised in that the section of the sleeve (7) is a square.

9. A sled according to claim 1, characterised in that the rear portion (16) of the container is formed so that the means (7, 8, 9, 10, 11, 12) for attaching the handles detachably are in the upper part (16a) of the rear wall and the lower part (16b, 16c) of the rear wall is retracted for making possible to use the sled as a kick sled.
